

## ABSTRACT OF THE DISCLOSURE

An attachment mechanism for a first object to be releasably attached to a second object includes a backer/stabilizer that has a first surface and a second surface opposite the first surface. The backer/stabilizer is semi-rigid, and may be formed out of plastic, poster board, card stock, or the like. The attachment mechanism includes a first Velcro® pad that has a front side with a Velcro® surface and a back side that is adhered to a second surface of the backer/stabilizer. The attachment mechanism also includes a second Velcro® pad that has a front side with a Velcro® surface and which is configured to be releasably attached to the front side of the first Velcro® pad. The attachment mechanism further includes a second adhesive strip that has a first adhering surface for adhering to a back side of the second Velcro® pad, and a second adhering surface for adhering to a surface of the second object. The backer/stabilizer is attached to the first object by either gluing, stapling, using adhesive tape, or sewing it onto the first object.
